Joseph Darnel ETENO-IZAKINOT

Web Fundamentals Checkpoint

Introduction to Problem-Solving Techniques:
Part 1 : Intro to the Web

Content

1 How does the web works ?

2 What do you need to be a web developer ?

3 Why did you choose to learn web development ?

1. How does the web works ?

The web works through communication between a client and a server. When a user enters a URL in a browser, the browser sends an HTTP request to a web server. The server processes the request and sends back a response, usually HTML, CSS, JavaScript, images, or data. The browser then renders this content so the user can interact with the website.

2. What do you need to be a web developer ?

To become a web developer, you need:

- A good understanding of HTML, CSS, and JavaScript.
- Knowledge of a frontend framework such as React or Next.js.
- Knowledge of backend technologies such as Node.js and Express.
- Understanding of databases such as PostgreSQL or MongoDB.
- Familiarity with version control tools like Git and GitHub.
- Problem-solving skills, logical thinking, and continuous learning.

3. Why did you choose to learn web development ?

I chose to learn web development because I am passionate about technology and software development. I enjoy building digital products and solving real-world problems through code. Web development allows me to create modern applications that can be used by people anywhere in the world.

It also aligns with my long-term goal of building AI-powered web and mobile applications through my agency. By mastering web development, I can create innovative products, improve businesses through technology, and continue growing as a professional software engineer.

Thank you
